MICROSOFT FABRIC & POWER BI DEVELOPER | SQL | ANALYTICS ENGINEERING

PROFILE

I started my career in technical and application support within the freight forwarding industry, where I built up a good understanding of CargoWise, business processes and how different departments use their systems. This gave me a strong foundation when I moved into data analysis, as I already understood where the data came from and how the way people use these systems can affect the quality and accuracy of reporting.

I've since developed my skills in SQL, Power BI and Microsoft Fabric, which I introduced and implemented at Xpand Logistics. I built the Fabric environment from the ground up, bringing together data from many different sources and establishing it as the central reporting environment now used across the business. My main focus is developing and maintaining this environment, improving the data behind it and delivering Power BI reporting across the business. Alongside this, I work on projects involving CargoWise, data quality and improving business processes to make better use of existing systems and improve the data feeding into the reports.

EXPERIENCE

Application Support Analyst - BI — **April 2024 - Present**

Xpand Logistics Limited | Basildon, Essex

- Introduced Microsoft Fabric at Xpand Logistics, building a central data environment that brings together information from multiple business applications and provides reusable data models for reporting across the business.
- Use SQL and ETL to bring data together from CargoWise and other sources, then load it into Fabric for reporting in Power BI.
- Maintain Fabric pipelines, lakehouses, semantic models and daily data refreshes, making changes when business requirements develop.
- Replaced a manual finance reporting process that could take up to three weeks each month with daily Power BI reporting, improving financial visibility and helping identify unnecessary costs.
- Developed transport performance reporting covering profitability, carrier performance and vehicle utilisation, identifying cost allocation issues and supporting operational changes that helped turn the department profitable.
- Built productivity and capacity reporting using Viva Insights, PeopleHR and CargoWise data, highlighting underutilised capacity and its financial cost to support resource allocation and recruitment decisions.
- Managed a CargoWise master-data project cleaning thousands of potential duplicate organisations and incorrect records, providing SOP guidance on processes and Power BI reporting to track progress.
- Set up and maintain CargoWise security.
- Managed the CargoWise invoice processing portal rollout and supported the CRM rollout, also providing Power BI reporting to track progress and analysis once adopted.
- Investigate and resolve issues across business applications, identify data quality problems and opportunities to improve processes, support users and assist the IT helpdesk when needed.

Application Support Analyst - Level 4 Data Analyst Apprentice — **May 2022 – March 2024**

Xpand Logistics Limited

- Completed the Level 4 Data Analyst Apprenticeship with Distinction while supporting business applications and developing practical experience in SQL, data analysis, Microsoft Fabric and Power BI.
